

Validation Solutions

Grow your parking business: Benefit from the many validation and cross promotion possibilities

Single or multiple validation solutions

- Single validation: the ideal option for validations by a single provider.
- Multi-validation: lets customers collect accumulated discounts at multiple providers.

Lots of promotional options for retailers

- On-line validation or manual validations by means of thermal validation stamp
- As an alternative to using validation devices, retailers may obtain validation cards for giving out to customers.

Full control of all claimed validations

- Built-in off-line counter on validation device
- All uses of parking validations are registered
- On-line systems generate reports for your parking system to ensure the correct application of rate discounts.

Everyone's a winner!

- End users save money.
- Retailers provide convenient customer parking to boost profitability.
- Validations allow them to win new patrons by giving them a good reason to come and use the parking facilities.

Features of validations

- Validations can be combined, regardless of the way they are issued (manual validation, validation ticket, validation stamp, SKIDATA value-based card, value-based card of an external ticketing system, or discount/extra charge linked to an article).
- Individual validations may be of different type (e.g. cash, time, or percentage based, or switch to a different rate).
- The final amount payable is calculated independent of the sequence in which the validations are applied.
- In addition, the specifics for the acceptance of validations and calculation of rate reductions can be configured over the Transaction Interface.
- Receipts can be issued for each individual validation.
- All transaction details, including validation specifics and the calculated rate, can be viewed and optionally printed out at the Manual.Cash.
- Validation reports with the following details can be generated for each individual customer:
 - Validation provider
 - Validation type
 - Applicable parking duration
 - Applicable time windows

Features of on-line validations

- On-line transfer of a ticket ID to Parking.Logic for one or more validations
- The ID number of the ticket can be entered manually or read by means of a barcode scanner
- Both partial and full (100 %) validations via external validation providers are supported (with payment at an external POS)
- Multiple validations can be successively applied to the same ticket

Features of Thermal Validation Stamp

- Provides ease of use for operating and cashiering personnel through simple, one-handed issuing of validations – anti-flip protection prevents misapplication
- Reliable, fraud-proof validations, thanks to use of marking (barcode) that is only machine readable
- The validation provider number is also printed onto the ticket as a decimal number
- 2-digit validation provider number for barcoded tickets
- 4-digit validation provider number for magnetic stripe tickets
- Mechanical counter provides additional verification
- Printer logic prevents imprecise barcode printing
- Visual status indication for 'warm-up', 'ready' and 'printing' modes
- Potentiometer for individual adjustment of the print intensity to suit the ticket quality
- Optional printing of additional information on the ticket

For a technical description see Factsheet Thermal Validation Stamp

Features of the Validation Ticket

- Can be optionally pre-produced via Coder Unlimited
- Suitable also for print shop production
- Percentages or absolute validation amounts
- Ticket can be used to effect application of a flat rate or special tariff
- Validation transactions can be evaluated via Reports and Validations program
- Support for combination with credit/debit card or electronic purse
- Optional acceptance of one or multiple cards per transaction
- Defective Validation Tickets can be replaced at the Manual Pay Station
- Supported data carriers: barcoded tickets, magnetic stripe tickets
